| Trade Name Index | 267 |
| (Alphabetical list of boiler trade names, with page numbers in Data Section where specifications appear.) | |

FOREWORD

THIS ENLARGED and revised edition is presented to the heating trade and other professions and businesses interested in residential and small commercial heating to bring up-to-date the original edition of the Beacon Boiler Reference Book, published in 1940 as the first single book containing essential data on practically every low pressure heating boiler. Every precaution has been taken to avoid errors or omissions; and ratings are included on each model of boiler on which it was possible to secure data.

SIZES COVERED

Because it was necessary to limit listings at some point, in view of the obvious impossibility of including the entire range of boilers, this work has been confined to boilers rated up to 3,000 sq. ft. of steam, and equivalent hot water radiation. All data published in the original edition are reproduced herein, plus information on new and current makes. Most boiler series with capacities near 3,000 sq. ft. continue in sizes too large to be included.

DISCUSSION OF LISTED DATA

All data given here have been obtained from boiler manufacturers or their published literature and specifications. All ratings are the manufacturers', and the explanations of ratings, where available, also are those given by the manufacturers. Nothing has been added to ratings or other published data by the editors, nor has any attempt been made to interpret or revise the information furnished. Any questions concerning ratings, or other specifications, should be taken up with the individual manufacturers.

Only basic information has been gathered on the boilers listed. The possibility is recognized of showing various other data, such as the location and size of tappings and bosses for pipe and coil connections, control mountings, height of water level, size of riser and return connections and similar information usually included in manufacturers' specification sheets. Since tabulated information must be limited, and since it is felt that the chief use of this volume will be to supply less obvious information on boilers found operating in the field, no attempt was made to include much of the physical data, other than that which might be required to identify the model and number of the boiler. Further, there was found no uniformity of reporting or showing much of these data to make possible representative and accurate listings.

Readers requiring detailed information on any current boiler models are advised to consult the manufacturers of the boilers, and manufacturers of various specialty equipment who are advertising in this Book. Many of them have compiled a wealth of data concerning boiler facilities for their equipment, which is available to users and to the trade. Catalog sheets on current boiler models supply more detailed information than can be put in tabular form.

EXPLANATION OF RATINGS AND SYMBOLS

Ratings shown assume a heat emission of 240 Btu per sq. ft. per hour for steam and 150 Btu per sq. ft.

per hour for hot water. Many manufacturers now rate water boilers for higher temperature water, but these variable ratings are not shown. Boiler manufacturers can supply such information to those who want it.

Steam and hot water ratings shown are those indicated by the manufacturer, or by his literature from which the data was taken. Ratings are given in square feet, and a qualification shown beside the rating, or in a footnote, wherever possible.

There will be found such qualifications as Recommended Load, Total Load, Capacity, EDR—Equivalent Direct Radiation, SBI—Steel Boiler Institute (SHBI—for some earlier ratings of the Steel Heating Boiler Institute, former name of the group), AGA—American Gas Association, all of which indicate the maximum load that should be put on the boiler in piping, direct radiation and allowances for domestic hot water.

Net IBR—rating symbol adopted by the Institute of Boiler and Radiator Manufacturers, indicates the standing cast-iron radiation the boiler will handle, allowance already having been made for piping and pick-up and domestic hot water up to 75 gals. a day. Where a house has more than two bathrooms, some extra capacity should be provided. Such terms as Net Radiation, Net Installed, Standing, etc., also indicate that allowance has been made for piping in the rating the manufacturer quotes. None of these ratings allows for indirect water heating loads. Where no ratings are shown an approximation can be obtained by allowing 14 sq. ft. of equivalent steam radiation for each sq. ft. of heating surface.

CHIMNEY SIZES

Chimney sizes shown are all for one boiler and do not allow for additional chimney load.

BOILERS WITH NO RATING

(The following paragraphs and tables are reproduced with permission from the publication "Selection and Sizing pressure relief Valves to comply with ASME Boiler Code Requirements," published by McDonnell & Miller, Inc., 3500 N. Spaulding Ave., Chicago 18, Illinois.)

"In some cases it is impossible to ascertain a boiler rating. When this condition arises it is possible to obtain an approximate Gross Boiler Output utilizing the fuel input rate together with the heating value of the fuel and overall efficiency to obtain a rating. "The basic formula for determination of Gross Boiler Output is as follows:

SUMMARY FORMULA: To obtain Gross Boiler Output in Btu per hour for:

(Based on efficiencies given in Table Below)

Oil: Multiply input gallons per hour (gph) by 100,000

Natural Gas: Multiply input cu. ft. per hour by 750

Manufactured Gas: Multiply input cu. ft. per hour by 375

TABLE I
CAST IRON ROUND SECTIONAL BOILER RATINGS
With Two Intermediate Sections Between Fire Pot
and Dome

| Grate Diam. Inches | Gross Output—BTU. Per. Hr. Automatically-fired |
|-----------------------|---|
| 16 | 52,500 |
| 18 | 73,500 |
| 20 | 93,500 |
| 22 | 124,000 |
| 24 | 153,000 |
| 26 | 185,000 |
| 28 | 226,000 |
| 30 | 273,000 |
| 32 | 327,000 |
| 34 | 370,000 |

| | |
|---------------------------------------|---|
| Gross Boiler Output (Btu per hr.) | = |
| Fuel Input Rate (per Unit per Hr.) | x |
| Heating Value Fuel (per Unit) | x |
| Overall Boiler Efficiency | |

In determining the above Summary Formulae for various fuels, the following data were used; so for fuels with different heating values or for other efficiencies, the proper substitutions should be made.

| Type of Fuel | Heating Value of Fuel | Overall Efficiency Per Cent |
|------------------|-----------------------|--------------------------------|
| Oil | 140,000 Btu per Gal. | 70 |
| Natural Gas | 1,000 Btu per cu. ft. | 75 |
| Manufactured Gas | 500 Btu per cu. ft. | 75 |

Boilers Fired Beyond Normal Ratings: For various reasons it is found occasionally that a boiler is fired beyond its normal rating. Under such conditions a relief valve capacity selected to match the Rated Gross Boiler Output would be inadequate. Where it is known that boilers are over-fired, it is proper to determine the actual Gross Boiler Output by use of the formula referred to in this Section.

Cast Iron Boiler Ratings Based on Physical Dimensions: For many of the older type cast-iron boilers no reliable published rating information is available. As an alternate to the fuel input procedure outlined above, there are complete tables* available for estab-

lishing ratings based on physical dimensions of the boiler.

"It is obvious that any rating method based on boiler dimensions has the problem of attempting to reconcile the design differences of the several manufacturers. For round boilers, Table I gives boiler outputs based on actual grate diameter with two intermediate sections between the fire pot and dome sections.

Table 2 includes Gross Boiler Outputs for automatically-fired boilers.

TABLE 2
CAST IRON RECTANGULAR SECTIONAL BOILER RATINGS
Automatically-Fired Gross Output, Btu per Hour

| Overall Boiler Length Between Face, Front & Rear Section | Grate, Width, Inches | | | | |
|---|----------------------|---------|-----------|-----------|-----------|
| | 22 | 24 | 30 | 36 | 42 |
| 24 | 122,000 | 130,000 | | | |
| 36 | 211,000 | 230,000 | 296,000 | | |
| 48 | 304,000 | 340,000 | 458,000 | 564,000 | 690,000 |
| 60 | 423,000 | 471,000 | 642,000 | 792,000 | 983,000 |
| 72 | 484,000 | 565,000 | 855,000 | 1,035,000 | 1,260,000 |
| 84 | 513,000 | 604,000 | 1,035,000 | 1,285,000 | 1,565,000 |

MODEL DESIGNATIONS

Many manufacturers use "S" or "W" to designate steam or water boilers, respectively. In showing model numbers, the editors have omitted most of these letters to avoid duplicate listings of identical boilers. "J" frequently is used in model designations to indicate jacketed models. "O" for oil-fired units, "M" for stoker-fired boilers. Footnotes have been used freely to explain these and other symbols.

Some manufacturers reverse their model numbers to indicate water boilers. For instance, SJ10-4 or J10-4 might indicate a steam, jacketed boiler of the "10" series with four sections. The same boiler listed as W10-4 or 4-10 would indicate that it was unjacketed and to be used as a hot water boiler. Users are cautioned to look for similar or reverse listings when exact model designations cannot be located.

"ORPHAN" BOILERS

One of the chief uses of the volume should be to supply information on "orphan" boilers that still are encountered in the field. Literature on old models seldom is available, and for this reason an exhaustive search has resulted in the inclusion of much old and obsolete boiler data.

Where possible, there is indicated the date of the catalog from which the data were obtained, or the dates between which the boiler was in production. Also, there is indicated, where known, the models that have been discontinued or have become obsolete. Where doubt exists and no direct word was obtainable from the manufacturers, the notations have been omitted.

*Engineering Standards, Part II, Net Square Feet Radiation Loads in 70 Deg. Fahr., Recommended for Low-pressure Heating Boilers (1948) (Heating, Piping & Air Conditioning Contractors' National Association, 1250 Sixth Avenue of Americas, New York 20, New York)
